Exports

Overview

All reports available in the Prism Reports module are now available. These exports are designed to include additional fields supporting the use of pivot tables, and are not formatted reports.

Configuring Exports

Exports are set up very much like reports.

The screenshot shows the 'Exports' configuration page. On the left (1), a sidebar lists various export categories: Management, Traffic, Channel Group Utilization (selected), Detail, Incoming, Usage, User Adoption, Fixed Charges, and Custom. The middle section (2) displays the SQL script for 'Channel Group Utilization', which includes declarations for bit variables, a select statement with a case for @bitDateRangeTimeIsIncluded, and several if-statements for setting CSV headers. The script ends with an exec statement for the report usp_ChannelGroupUtilization. The right section (3) shows the 'Parameters' for this export, including buttons for 'Execute' and 'Schedule', date pickers for 'From' (30/07/2018 00:00:00) and 'To' (30/07/2018 23:59:59), a 'Dates' section with 'No filter applied', a 'Time Zone' dropdown set to '(UTC+00:00) Dublin, Edinburgh, L...', a 'Time is Included' dropdown set to 'Time Between', and time pickers for 'Time From' (00:00:00) and 'Time To' (23:59:59). Other parameters like 'Channel Groups', 'Line Types', and 'Codec' are also shown with 'No filter applied' or 'Active voice' settings.

The list of available exports is shown on the left (1). The details of the script (before execution) or the results are shown in the middle (2), and the parameters specific to the export are on the right (3). All details found in the [Reports](#) manual regarding parameters and report purposes apply to the corresponding Exports as well.

Note: Custom exports can be designed to meet specific requirements. Contact your own system administrator, or your Tiger account manager for more details.
